

The AI Travel Advisor

1. What is this and why is it useful?

Planning a trip usually requires a lot of back-and-forth messaging, which can take days and frustrate customers. It also takes up a lot of time for travel agents. This solution uses a smart AI assistant on WhatsApp to do the heavy lifting.

It chats naturally with the customer, understands what they need, automatically checks live prices for flights and hotels, and builds a complete trip package in seconds. A real human agent only needs to step in if the customer gets stuck or has a complicated request.

2. The Customer Journey (Step-by-Step)

1. **The Customer Says Hello:** A customer sends a normal WhatsApp message like, *"My family wants a 5-day trip to Kashmir next month. Budget is ₹80,000."*
2. **The AI Understands:** The AI reads the message and picks out the important details: the destination, the dates, the number of people, and the budget. If it needs more info (like where they are flying from), it politely asks.
3. **The AI Does the Shopping:** In the background, the AI instantly connects to travel systems to check live prices for flights, available hotels, and sightseeing tours to see if it can build a trip under the ₹80,000 budget.
4. **Sending the Quote:** Within seconds, the AI creates a beautifully formatted PDF brochure with a day-by-day plan and the total cost. It sends this file directly into the WhatsApp chat.
5. **Saving the Details:** The AI automatically creates a profile for this customer in the company's database (CRM). It saves their contact info and what they are looking for so the sales team has a record of it.
6. **Handling Objections & Human Handoff:** If the customer complains that the price is too high, the AI can try to suggest a cheaper hotel. If the customer gets frustrated, the AI instantly connects them to a real human agent. The human agent can see the entire chat history on their screen, so they never have to ask the customer to repeat themselves.

3. The Coolest Features

- **Voice Messages:** Customers don't have to type. They can just send a voice note on WhatsApp. The AI will listen to it, understand the travel request, and reply.
- **Reading Photos (like Passports):** Instead of typing out complicated details for booking, the customer can just take a picture of their passport. The AI reads the picture and

automatically fills out their travel details.

- **Smart Reminders:** If a customer gets their quote but forgets to reply, the AI can automatically message them two days later saying something like: *"Hi Mohan, your Kashmir trip is still available! Would you like a 10% discount to book it today?"*
- **Manager Dashboard:** Business owners get a simple dashboard showing how many trips the AI handled completely on its own, how much money it helped make, and how much time it saved the human staff.

4. Workflow Diagram

Below is a structural diagram showing how a customer message travels through the system from WhatsApp to a live agent.
